

Selected Topic: 3 (Pandemic Flu Spread)

Group 72: Clayton Siman

I have started on the opening of the project and the deterministic parts of the question. The entire project is roughly split into 2 parts:

1. The deterministic part with statistical distributions and expectations
2. The simulation part with simulations of the flu spread in 2 scenarios: regular scenario and an immunized scenario

I have completed the introduction, problem statement, and the deterministic parts of the question (parts a, b, and c) since they were more straightforward to answer.

I am now left with the simulations which are more tedious to complete, as well as the findings and conclusion for this project. I aim to focus more on the findings on how immunization curbs the spread of the flu by evaluating the simulation results of part d and e, and how immunization can be essential in real-world applications to contain infectious diseases.
